SUMMARY

Enthusiastic B.Tech CSE (Cybersecurity specialization) student skilled in working with **linux, networking fundamentals, firewalls, IDS/IPS, Windows Server 2025, Ubuntu server and SOC operations**. Knowledgeable in **SIEM tools, VAPT tools** and **best practices** with hands-on exposure to **defensive security tools**.

TECHNICAL SKILLS

- **Languages** : Python, Bash scripting
- **OS**: Linux distributions, Windows
- **DevOps** : Docker, AWS
- **Tools** : Git, GitHub, Postman, Networking tools (nmap, netcat), VAPT tools (Burp Suite)

PROJECTS

Self-Hosted WebRTC Infrastructure on Private Server (Data Center-Style Setup) - Designed and deployed a private server infrastructure similar to a small-scale data center to host and manage real-time communication services.

Tech Stack: Linux Server, WebRTC, Docker, Networking, Reverse Proxy, TURN/STUN

- Built and configured a dedicated server environment to host WebRTC services for real-time video and communication applications.
- Implemented containerized deployment using Docker to manage WebRTC services efficiently and ensure scalable infrastructure.
- Configured secure networking, reverse proxy routing, and TLS encryption to provide production-ready HTTPS connectivity.
- Deployed and optimized TURN/STUN servers to maintain stable WebRTC connections across NAT and firewall-restricted networks.

SIEM Lab – Threat Detection & Monitoring Environment - Designed and deployed a Security Information and Event Management (SIEM) lab environment to monitor and detect potential threats on a local host system.

Tech Stack: SIEM, Linux, Log Monitoring, Network Security

- Configured centralized log collection and monitoring with real-time alerting to analyze system and network activities, enabling detection of suspicious behavior and potential security incidents.

Firewall Lab – Network Traffic Filtering and Security Rules

Designed and implemented a software-based firewall lab to understand and demonstrate network traffic filtering and firewall rule enforcement.

Tech Stack: Linux Firewall, Networking, Security Policies

Configured and tested firewall rules to control inbound and outbound traffic based on ports, protocols, and IP addresses, demonstrating protection against unauthorized access and network-based threats.

EXPERIENCE

Cybersecurity Engineer- TechCadd | Jan 2026 – Present

- Designed and deployed a secure server environment to simulate enterprise infrastructure and cybersecurity practices.
- Configured network architecture including IP addressing, routing, and secure connectivity for lab environments.
- Implemented system hardening and firewall configurations to protect servers from unauthorized access and network threats.
- Deployed and managed self-hosted services including WebRTC infrastructure for real-time communication applications.
- Tested network security controls through firewall rule configuration and traffic filtering demonstrations.

EDUCATION

GNA University, Phagwara

Bachelor's Degree in Computer Science and Engineering | July 2022 - July 2026 (Expected)
